

gopass a dope CLI password-manager

Austin OWASP Cryptoparty

Jan 2022

What the heck is gopass?

gopass is a password manager for the command line written in Go.

It works on all major desktop and server operating systems (Linux, MacOS, BSD, Windows).

<https://github.com/gopasspw/gopass>

Why use gopass?

First of all, USE A PASSWORD MANAGER.

Reasonable password manager options:

- gopass (Open Source)
- bitwarden (Open Source / Commercial)
- 1Password (Commercial)
- Lastpass (Commercial)
- Dashlane (Commercial)

Okay, but why use gopass?

I use gopass in a self-hosted git repository behind a wireguard connection.

- Mobile sync - <https://github.com/mssun/passforios>
- Browser
- Easily sync between multiple computers.
- Easy backups due to git version control.
- Multiple stores and sharing is possible.

Installing gopass

Assuming you have a working shell and Go is correctly installed:

```
$ go install github.com/gopasspw/gopass@latest
```

Setup Gopass

Assuming you have a working shell and Go is correctly installed:

```
$ go install github.com/gopasspw/gopass@latest
```

Demo Gopass

gopass cheat-sheet : <https://woile.github.io/gopass-cheat-sheet/>

Problems

Problems with gopass:

- iOS version doesn't support multiple stores.
- Might be risky to use a private repo on public github/gitlab
- Doesn't scale as well as other secret management systems such as HashiCorp Vault

Questions?

What do you guys use? Any alternatives?

Any questions?
